

A Business Data Management Project Presentation

Sales Insights and Operational Challenges in a Local Bangle and Wool Store

PRESENTED BY
VIVEK MITTAL
ROLL NO : 23F1001475

Project Overview

- This project analyzes the sales operations of Naina Kangan and Wool Store, a local retail and wholesale business in New Market, Doiwala, Dehradun (248140), Uttarakhand.
- The store is owner-managed, with limited family assistance during peak hours, reflecting a small-scale setup.
- Deals in bangles and wool based products, serving both B2C & B2B customers.
- Sales are season driven, with wool demand peaking in winter and bangle sales rising during festive periods.

Project Goal

- To conduct a systematic analysis of the sales operations of Naina Kangan and Wool Store in order to understand demand behavior and improve overall business performance.

Supporting Objectives

- To assess seasonal demand trends for bangles and wool based products.
- To identify key operational and sales-related challenges faced by the business.
- To develop practical, data-driven recommendations for enhancing sales and operations.

BACKGROUND RESEARCH

Problem Statements

1

Seasonal Demand Fluctuation

- Sales fluctuate sharply with seasons
- Wool demand peaks in winter; bangle sales rise during festivals

2

Unsystematic Stock Handling

- Inventory decisions rely on intuition rather than structured sales records
- Results in overstocking of slow-moving items and shortages during peak demand

3

Limited Customer Acquisition Channels

- Business depends almost entirely on word-of-mouth
- No customer tracking or digital presence to measure growth or retention

Key Insight

Collectively, these issues highlight a fundamental gap in structured data usage, causing the business to operate reactively rather than through planned and informed decision-making.

Problem Solving Approach

- Digitized monthly sales data in Excel
- Used Pivot Tables to identify seasonal demand cycles
- Compared festival vs non-festival revenue
- Forecasted high-demand periods for better stock planning.

- Conducted product-wise sales analysis
- ABC–XYZ inventory model is being implemented
- Identified fast-moving & slow-moving products
- Capital allocation is being prioritized based on demand stability

- Recorded retail and wholesale customer data
- Customer purchase patterns are being analyzed
- Created WhatsApp Business & Google Business profile
- Collection of customer-level data is recommended to enable future RFM-based segmentation.

Analysis Methodology

Analytical Process

- 2,424 transaction-level records analyzed over the study period
- Total revenue examined: ₹12,19,396
- Data digitized from manually maintained sales registers
- Data cleaning performed to remove inconsistencies and standardize entries
- Descriptive statistical analysis applied to identify trends and variations
- Monthly and seasonal aggregation applied
- Product category-wise comparison conducted
- Customer type and transaction-level analysis performed

Seasonal Sales Analysis & Revenue Trends

- Highest monthly revenue: October – ₹3,19,897
- Lowest monthly revenue: September – ₹12,990
- Significant revenue spike during festive period
- Monsoon(July, August, September) and Autumn/Festive(October) seasons generate peak revenue
- Winter months generating ₹2,93,366 total revenue

- Spring(March, April) and Summer(May, June) months reflect comparatively lower activity
- Revenue pattern is cyclical rather than stable
- Seasonal dependency indicates demand concentration in specific periods
- Sales fluctuations highlight vulnerability during lean months

Transaction & Customer Insights

- Majority of transactions fall in ₹0–₹499 range
- Distribution is strongly right-skewed
- Few high-value transactions significantly impact total revenue

- B2B transactions: 1,308
- B2C transactions: 1,116
- Average B2B transaction value: ₹633.04
- Average B2C transaction value: ₹350.70
- Wholesale customers generate higher per-transaction revenue
- Retail ensures frequency stability
- Wholesale drives revenue spikes

Product Type Performance & Profitability Analysis

- Gross profit distribution shows strong variation across items
- Bangles Box generates the highest gross profit (₹1,42,650)
- Knitting Needle (Pair) records the lowest gross profit (₹1,490)

- Revenue is highly concentrated in a few product types
- Bangles Box contributes the largest revenue share (53.72%)
- Other product types contribute comparatively smaller shares.
- Profitability is uneven across product types
- High-revenue items also dominate margin contribution
- Some low-revenue items provide limited financial impact

Recommendations and Conclusions

Strategic Recommendations

- Implement basic seasonal demand forecasting using historical monthly data
- Apply ABC-based inventory prioritization to reduce capital blockage
- Monitor and plan around high-value wholesale transactions
- Begin structured customer data recording (basic contact tracking)
- Gradually increase digital payment adoption for transparency
- Improve local digital visibility for business expansion

conclusions

- Business performance is seasonal and demand-driven
- Revenue concentration creates operational risk
- Transaction-level analysis reveals mixed B2B–B2C structure
- Structured data analysis enhances clarity in decision-making
- Even simple analytical tools can significantly improve small retail efficiency

THANK YOU
